Description

This dual channel thermocouple data logger is suited for measuring temperature with the following thermocouple types: K, T, J, B, E, N, R and S.

Featuring two thermocouple inputs, the YL-T16 is ideal for measuring surface temperature, air temperature or product temperature.

The data logger has an integrated reference junction for temperature and delivers proper readings within a large temperature range. The resolution in the range of -100 to +1300°C is 0.05 K with an accuracy of $\pm 0.3K$.

To get the overall accuracy simply add the figures for the thermocouple.

The YL-T16 is also available as an extended memory version that will record 4 million readings. See the related products tab for more information.
